FCC INFORMATION

This equipment has been tested and found to comply with the limits of a Class B digital device, pursuant to part 15 of the FCC Rules. These limits are designed to provide reasonable protection against harmful interference in a residential installation. This equipment generates, uses and can radiate radio frequency energy, and if not installed and used in accordance with the instructions, may cause harmful interference to radio communications. However, there is no guarantee that the interference will not occur in a particular installation. If this equipment does cause unacceptable interference to radio or television reception, which can be determined by turning the equipment off and on, the user is encouraged to try to correct the interference by one or more of the following measures -- reorient or relocate the receiving antenna; increase the separation between equipment and receiver; or connect the into an outlet on a circuit different from that to which the receiver is connected.

FCC WARNING

To assure continued FCC compliance, the user must use a grounded power supply cord and the provided shielded video interface cable with bonded ferrite cores. Also, any unauthorized changes or modifications to Amtrak products will void the user's authority to operate this device. Thus AmTRAN will not be held responsible for the product and its safety.

CE CERTIFICATION

This device complies with the requirements of the EEC directive 89/336/EEC with regard to "Electromagnetic compatibility."

SAFETY CAUTION

Use a power cable that is properly grounded. Always use the AC cords as follows - USA (UL); Canada (CSA); Germany (VDE); Switzerland (SEV); Britain (BASEC/BS); Japan (Electric Appliance Control Act); or an AC cord that meets the local safety standards.

Features

The VG150 are world class TFT LCD analog display monitors that include the following features.

1. Digital On Screen Display Controls

User friendly buttons (Power, Function, Select (+ / -), Auto) allowing for picture perfect quality. User can define display mode or reset to default settings. Help menu contains: Auto-Sync; Contrast; Brightness; OSD H-Pos; OSD V-Pos; Color; LCD Adjust; MISC and Exit.

2. Power Supply Support

Ability to accept voltages from 100~240 Vac (Universal), thus allowing a full range of input AC power supply.

3. Power Saving System

This environmental friendly product is able to reduce power consumption by 75% in Suspend Mode and by more than 95% in Off Mode.

4. Frequency Range

Monitor can support video standards from VGA to XGA, where Horizontal frequency ranges from 30~62kHz and Vertical frequency ranges from 50~75 Hz.

SPECIFICATIONS

Characteristic	Description
LCD Panel	ADI, 15.0 inch diagonal viewable screen, Anti-glare TFT Active Matrix Panel, 0.297 mm pixel pitch, TDK Inverter
Maximum Viewing Angles	Left : 60° Right : 60° Up : 45° Down : 55°
Signal Input	Video : RGB analog, 0.7 Vp-p, 75 ohms Sync : H/V separate or composite sync, TTL Horizontal : 30~62 kHz Vertical : 50~75 Hz
Connector	15 Pin Mini D-Sub
Maximum Resolution	1024x768
Video Bandwidth	100 MHz nominal
Display Area	304.1mm (H) x 228.1mm (V)
Power Voltage	100~240Vac @ 50 ~ 60 Hz (auto switch), 12Vdc 3A
Power Consumption	38 W max.
Operating Conditions	Temperature : 32° to 104° (0° to 40°) Humidity : 10% to 90% (no condensation) Altitude : To 10,000 feet
Storage Conditions	Temperature : -4° to +140° (-20° to +60°) Humidity : 10% to 90% (no condensation) Altitude : To 10,000 feet
Dimensions	Physical : 390mm (W) x 372mm (H) x 138mm (D)
Weight	5.0 kg

ON SCREEN DISPLAY

OSD (On Screen Display) function is supported on each the TFT LCD analog display monitors and is controlled by four easy to use buttons – Power, Function, Select (+), Select (-), Auto.

Function	Sub-Function	Value
Auto Sync		
Contrast		0 ~ 100
Brightness		0 ~ 100

INVERTER BOARD I/O CONNECTIONS

NOTE: MANUFACTURER'S NAME MUST BE ON THE PRINTED SIDE FOR THE INVERTER BOARD TO BE FACING UP.

THEORY OF CIRCUIT OPERATION

The VG150 are multi-frequency and multi-mode color TFT LCD monitors. It supports true XGA resolution of 1024x768 including SVGA, VGA and other various high resolution modes up to 1024x768 for IBM, PC compatibles, Power PC and Macintosh. The TFT LCD panel, with a 0.288 mm pixel pitch, provides sharp flicker-free images.

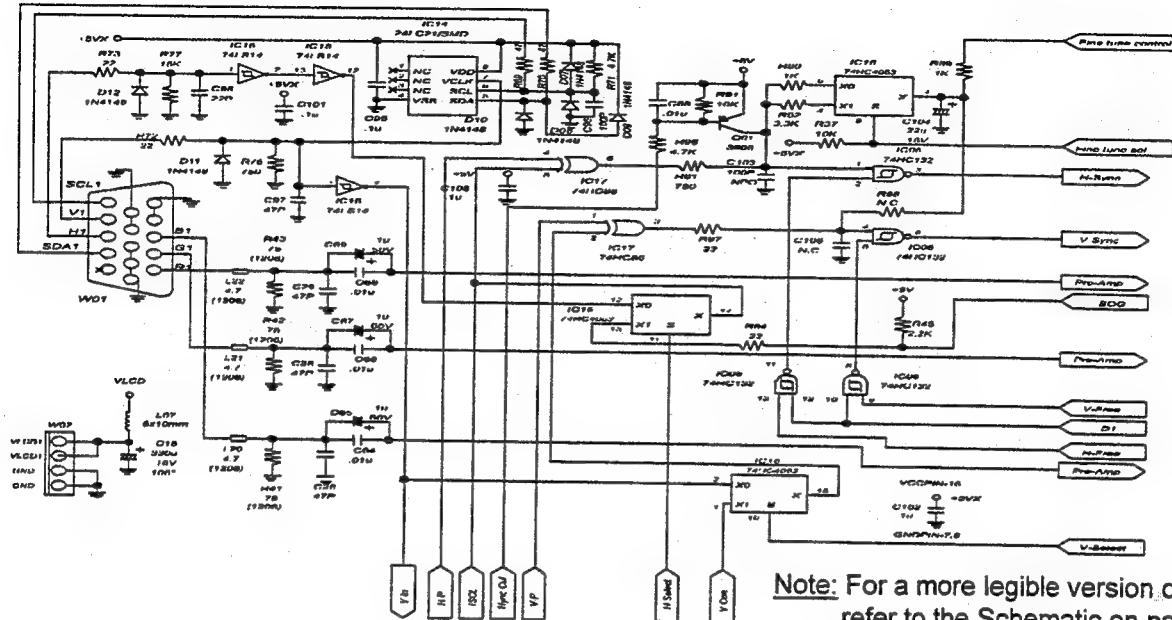

As the previous block diagram illustrates, the VG150 uses the Analog Interface Controller (IC20) ASIC for mode detection and resolution amplifying from its preset values. The purpose of the two set of PLL is to provide the clock from multiple horizontal synchronous frequencies. PLL0 provides A/D converter's sample clock with the ICS1523 (IC09) while PLL1 produces the LCD panel's dot clock with the TLC2933 (IC03).

Furthermore, each TFT LCD monitor uses the 24LC21 (IC14) chip to provide DCC1™ and DCC2B™ with Plug&Play. Also included in each monitor is a mode detection feature to examine the H-Sync frequency input level to decide for power saving mode. Power saving will shut down certain components, including excess electrical power to reduce power consumption.

Upon receiving video signal input, the Analog Interface Controller (Digital Process and Control System) will trigger the mode detection function such that the internal controls can use the ROM's preset information to drive the Analog Interface Controller. In addition, the preset values can determine A/D converter clock; LCD dot clock; line buffer input/output rate; V-Sync and H-Sync pulse width; back porch and front porch to provide optimal performance for the TFT LCD monitors.

Digital process and control system allows users to control OSD menu values to change monitor settings that includes audio volume, contrast, brightness, color, H/V position, and H size. The following sections are a breakdown of the TFT LCD display control board's major sections.

THEORY OF CIRCUIT OPERATION

Note: For a more legible version of this drawing, refer to the Schematic on page 59.

This product uses 74HC4053 as a signal switch in order to support Composite SYNC and SYNC on Green timings. The MPU(IC25) in this product provides the differentiation function to the Composite SYNC, so the SYNC processor circuit is simplified. The free run function in this product also make user to easily know the input signal is out of product specification or interrupted. When separated SYNC is detected through the V-in and H-in, MPU will set both the H-select and V-select to low level. If the composite SYNC is detected, the H-select is low level and V-select will be high level. If the SOG is detected, both H-select and V-select are in high level.

V-com is the vertical SYNC separated from the Composite SYNC through MPU. If the input signal is out of specification or interrupted, the free run mode will be activated. The free run SYNC comes from the pin 39 and 40 of IC02.

At this condition, the Hync-cut is low level and the pin 1 of IC06 is always high level.

Above condition plus the condition that the free run enable is also in high level, the V-free and H-free will activate the free run mode.

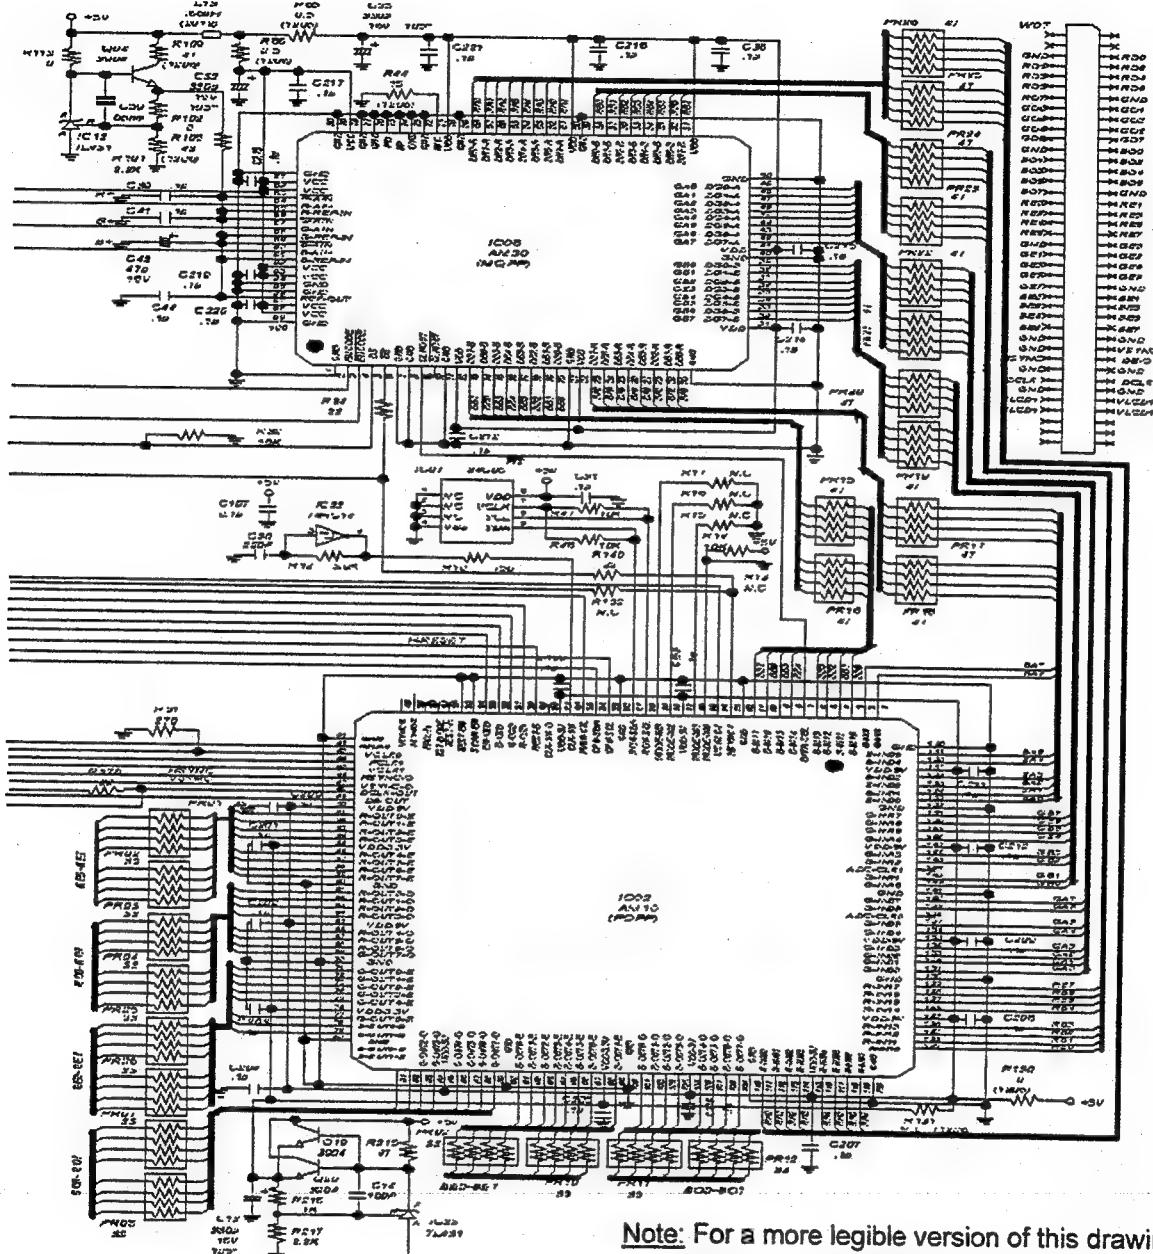

THEORY OF CIRCUIT OPERATION

This product supports timing from VGA to XGA, so the pixel rate is from 25 MHz to 80 MHz. In order to make the phases of sampling clock and video to be closed to each other easily and precisely when user uses the fine tune function, the phase delay effect in the high pixel rate is smaller than that in the low pixel rate. The MPU will choose the proper phase adjustment circuit through the pin 4 of IC25, fine tune select.

The fine tune control is a PWM signal. When I²C changes the control register the MPU also changes the fine tune control duty cycle. The changed duty cycle will become DC level through R89 and C104. When detecting pixel rate larger than 50 MHz, the MPU will set the fine tune select to high level. If the pixel rate is smaller than 50 MHz, the fine tune select will set to low level. The R52, R59, R80 and C103 are all phase adjustment components.

This product supports DDC 1/2B by using 24LC21. The 24LC21 is a 128x 8 bits EEPROM. This chip is designed to use in applications requiring storage and serial transmission of configuration and control information. Two modes of the operation have been implemented, the Transmit Only mode and Bi-Directional mode. Upon power up, this device will be in the Transmit Only mode, sending a serial bit stream of the entire memory array contents, clocked by the VCLK pin. A valid high to low transition on the SCL pin will cause the device to enter the Bi-Directional mode with byte selectable read/write capability of the memory array.

THEORY OF CIRCUIT OPERATION

Note: For a more legible version of this drawing,
refer to the Schematic on page 59.

AM30 is a triple 8-bits A/D converter optimized for XGA LCD monitor with maximum sample rate of 96 MSPS. It can support both single-channel and dual-channel digital outputs. The analog input range of AM30 is (0.6V ~ 2.6 V). The external top reference voltage (2.6V) and bottom reference voltage (0.6V) reference voltage is required. AM100 is a highly integrated analog interface. The analog input R.G.B. signals are first sampled by six channels of A/D converter (AM30, choose dual-channel digital output) and the 48-bits R.G.B. data are then fed into

THEORY OF CIRCUIT OPERATION

AM100

The AM100 is capable of performing automatic detection of the display resolution and timing of the input signals generated from various graphic cards. The AM100 then automatically scales the input image to fill the full screen of the LCD monitor. The AM100 can interface with TFT LCD panels from various manufacturers by generating 48-bits R.G.B. signal to the LCD panel based upon the timing parameter saved in the EEPROM (IC07).

The AM100 has the following major functions;

1. Input mode detection.
2. Auto calibration.
3. Image scaling.
4. Image interpolation and dithering.
5. OSD mixer.

The following sections will describe the functions.

Input Mode Detection

The AM100 can automatically detect the mode of the input signal without any user adjustment or driver running on the PC host or external CPU. It automatically detects polarity of input synchronization and the sizes of back porch, valid data window and the synchronization pulse width in both vertical and horizontal directions. The size information is then used not only to decide the input resolution, to generate the frequency driver for the input PLL. To lock with HSYNC, but also to automatically scale the image to full screen, and to synchronize the output signal with the input signal.

The detection logic is always active to automatically detect any changes to the input mode.

Auto Calibration

The AM100 can automatically calibrate the phase of the sample clock in order to preserve the bandwidth of input signal and get the best quality. The AM100 implements a proprietary image quality function. During auto-calibration process, the AM100 continues to search for the best phase to optimize the image quality. The output image may display some jitter and blurring during the auto-calibration process, and the image will become crisp and sharp once the optimum phase is found. User can change the sampling clock phase value by the external CPU. The phase calibration process can be delayed and even disabled by the external CPU if system designer wants to have his/her own implementation. The phase calibration can be independently turned ON or OFF by external CPU. When the calibration is turned OFF, external CPU can change the input mode and frequency definitions.

THEORY OF CIRCUIT OPERATION

Image Scaling

The AM100 supports several different input modes, and the input image may have different sizes. It is essential to support automatic image scaling so that the input image is always displayed to the full screen regardless the input mode. The AM100 scale the images in both horizontal and vertical directions. It calculates the correct scaling ratio for both directions based upon the LCD panel resolution, and the input mode and timing information produced by the input mode detection & auto calibration function. The scaling ratio is re-adjusted whenever a different input mode is detected. The ratio is then fed to the buffer memory read control logic to fetch the image data with the right sequence and timing. Some of the image data may be read more than once to achieve scaling effect.

Image Interpolation

The AM100 supports image interpolation to achieve better image quality. A basic image scaling algorithm replicates the input images to achieve the scaling effect. The replication scheme usually results in a poor image quality. The AM100 implements both bi-linear interpolation and a proprietary programmable interpolation algorithm. The programmable interpolation is implemented with a 256-entry mapping table in the EEPROM to allow system user to adjust the bi-linear interpolation parameters to control the sharpness and smoothness quality of the image. In the default setting, the mapping table contains a straight line of slope equal to 1, i.e. the data in entry N equal to the value N. If the mapping table contains a line of slope equal to 2, then the output image will be a bit sharper than image generated by a table with the default setting.

Dithering

The AM100 supports 16.7 million true colors for 6-bit panel. Two dithering algorithms are implemented and again users can chose between them through the external micro-controller. The first one is area-based dithering, and the second one is a frame-based frame modulation, or called frame rate control. Through external micro-controller, users can choose among different dithering algorithm.

OSD mixer and LCD interface

At the output stage, the AM100 performs the OSD mixer function, and then generates 24-bit / 48 bit RGB signal to the LCD panel with the correct timing.

THEORY OF CIRCUIT OPERATION

OSD mixer

In the OSD mixer block, the AM100 mixes the normal output RGB signal with the OSD signal. The OSD output data is generated based on the R OSD G OSD and B OSD pins as well as the OSD Intensity data in EEPROM entry. When the EN OSD is active high, the OSD is active, and the AM100 will send the OSD data to the LCD panel. The OSD has 16 different color schemes based on the combinations of the three OSD color pins and the OSD Intensity data. When R OSD=1, OSD Intensity=0, the AM100 will output 128 to the output red channel, R OUT. When R OSD=1, and OSD Intensity=1, the AM100 will output 255. The same scheme is used for G-OSD to G-OUT and for B-OSD to B OUT.

EEPROM interface

As mentioned in previous sections, the external EEPROM stores much crucial information for the AM100 internal operations. The AM100 interfaces with the EEPROM through a 2-wire I²C serial interface. The suggested EEPROM device is an industry standard serial-interface EEPROM (24x08). The I²C interface scheme is briefly described here and detail description can be found in many public literatures.

Input Mode Dependent Data

Res3 threshold	10	12AH-12BH	Upper bound of the line number for 640x480 mode, and lower bound for 800x600
Res4 threshold	10	12CH-12DH	Upper bound of the line number for 800x600 mode, and lower bound for 1024x768
Res5 threshold	10	12EH-12FH	Upper bound of the line number for 1024x768 mode, and lower bound for 1280x1024
Res6 threshold	10	130H-131H	Upper bound of the line number for 1280x1024 mode. If the input has more line than this threshold, it is considered INVALID mode
Mode 640x350 Sync Polarity	2	132H[1:0]	The polarity of input synchronization signals Bit 0 is for VSYNC and bit 1 is for HSYNC
Mode 640x400 Sync Polarity	2	132H[3:2]	The polarity of input synchronization signals Bit 0 is for VSYNC and bit 1 is for HSYNC
Mode 720x400 Sync Polarity	2	132H[5:4]	The polarity of input synchronization signals Bit 0 is for VSYNC and bit 1 is for HSYNC
Mode 640x480 Sync Polarity	2	132H[7:6]	The polarity of input synchronization signals Bit 0 is for VSYNC and bit 1 is for HSYNC

THEORY OF CIRCUIT OPERATION

Symbol	Width (bits)	Address	Description
Mode 800x600 Sync Polarity	2	133H[1:0]	The polarity of input synchronization signals Bit 0 is for VSYNC and bit 1 is for HSYNC
Mode 1024x768 Sync Polarity	2	133H[3:2]	The polarity of input synchronization signals Bit 0 is for VSYNC and bit 1 is for HSYNC
Mode 1280x1024 Sync Polarity	2	133H[5:4]	The polarity of input synchronization signals Bit 0 is for VSYNC and bit 1 is for HSYNC
Maximum VBP	8	134H	The maximum vertical back porch for input video
PWM unit delay	13	135H-136H	The unit delay used in the external PWM delay circuitry. If the Free-running clock is 1MHz, and the intended unit delay is 0.2 ns (= 5,000MHz), then a value of 5,000MHz/1MHz =5,000 is used here.
Maximum link off time	22	137H-139H	Maximum time when input VSYNC is off before the LINK_DWN pin turns ON (unit: clock period of the free running clock). If the free-running clock is 1MHz, and the intended maximum time 1is 1 second, then a value of 1,000,000 us / 1us = 1,000,000 is used here.
Maximum refresh rate	16	13Ah-13BH	Maximum refresh rate supported by the LCD panel If the intended maximum refresh rate is 75Hz, and the free-running clock is 1MHz, then a value of 1000000/75=133,333 is used here
Maximum input frequency	8	13CH	Maximum source clock rate supported by the AM100 (unit: frequency of free-running clock) If the intended maximum clock rate is 60MHz, and the free-running clock is 1MHz, then a value of 60 is used here. If the input signal has a higher frequency than this value, the VCLK0_X status bit will turn ON.
Scale factor CE	8	13DH	Scale factor used when generate look up table for current even pixel multiplication
Scale factor CO	8	13EH	Scale factor used when generate look up for current odd pixel multiplication
Scale factor NE	8	13FH	Scale factor used when generate look up table for next even pixel multiplication
Scale factor NO	8	140H	Scale factor used when generate look up table for next odd pixel multiplication

THEORY OF CIRCUIT OPERATION

Symbol	Width (bits)	Address	Description
Offset factor CE	8	141H	Offset factor used when generator look up table for current even pixel multiplication
Offset factor CO	8	142H	Offset factor used when generator look up table for current odd pixel multiplication
Offset factor NE	8	143H	Offset factor used when generate look up table for next even pixel multiplication
Offset factor NO	8	144H	Offset factor used when generate look up table for next odd pixel multiplication
Scale factor V	8	145H	Scale factor used when generate look up table for line multiplication
Minimum pixels per line for LCD	11	147H-148H	Minimum number of pixels per line for LCD panel
LCD polarity	4	149H[3:0]	Controls the polarity of output VSYNV, HSYNC, clock and display enable Bit 0:0: clock active high, 1: clock active low Bit 1: 0: HSYNC active low, 1: HSYNC active high Bit 2: 0: VSYNC active low, 1: VSYNC active high Bit 4: 0: de active high, 1: de active low
Check sum	8	14AH	Sum of all part 9 bytes (keep only lower 8 bit)

Horizontal Interpolation Lookup Table

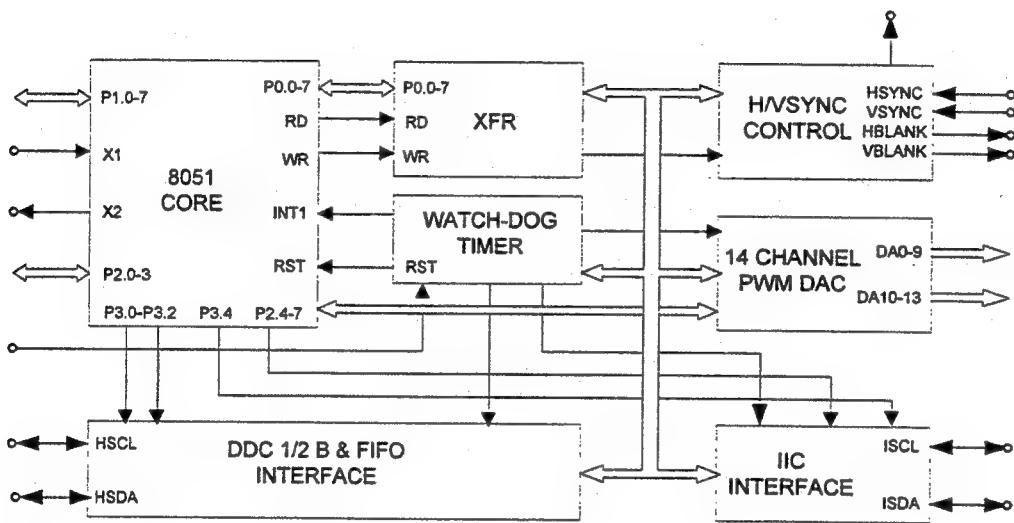

Symbol	Width(bits)	Address	Description
Mapped value	8	1C0H-2BFH	This is the base table for all four horizontal interpolation lookup tables. Each table is then generated by multiply this value With corresponding scale factor and added with corresponding offset factor.
Check sum	8		Sum of all part 10 entry (only keep lower 8 bits)

Vertical Interpolation Lookup Table

Symbol	Width(bits)	Address	Description
Mapped value	8	2E0H-3DFH	This is the table for vertical interpolation lookup table. The vertical interpolation table is then generated by multiply this value with vertical scale factor and added with vertical offset factor
Check sum	8	3E0H	Sum of all part 10 entry (only keep lower 8 bits)

THEORY OF CIRCUIT OPERATION

The MTV112E micro controller is an 8051CPU core embedded device specially tailored to CRT monitor applications. It includes an 8051 CPU core, 256 bytes SRAM, fourteen built-in PWM DACs, DDC1/DDC2B interface, 24Cxx series EEPROM interface, A/D converter and a 32K bytes internal program EPROM.

FUNCTIONAL DESCRIPTIONS

8051 CPU Core

1. The MTV112E includes all the 8051 functions with the following exceptions, PSEN, ALE, RD and WR pins are disabled. The external RAM access is restricted to XFRs within the MTV112E.
2. Port0, port3.3, and port3.5 ~ port3.7 are not general-purpose I/O ports. They are dedicated to monitor control or DAC pins.
3. INT1 and T1 input pins are not provided.
4. Port2.4 ~ port2.7 are shared with DAC pins; port3.0 ~ port3.2 port3.4 are shared with monitor control pins.

In addition, there are 2 timers, 5 interrupt sources and serial interface compatible with the standard 8051. The Txd/Rxd (P3./P3.1) pins are shared with DDC interface. INT0/T0 pins are shared with IIC interface. An extra option can be used to switch the INT0 source from P3.2 to P2.0. This feature maintains an external interrupt source when IIC interface

THEORY OF CIRCUIT OPERATION

The MTV112E pin functions are list below

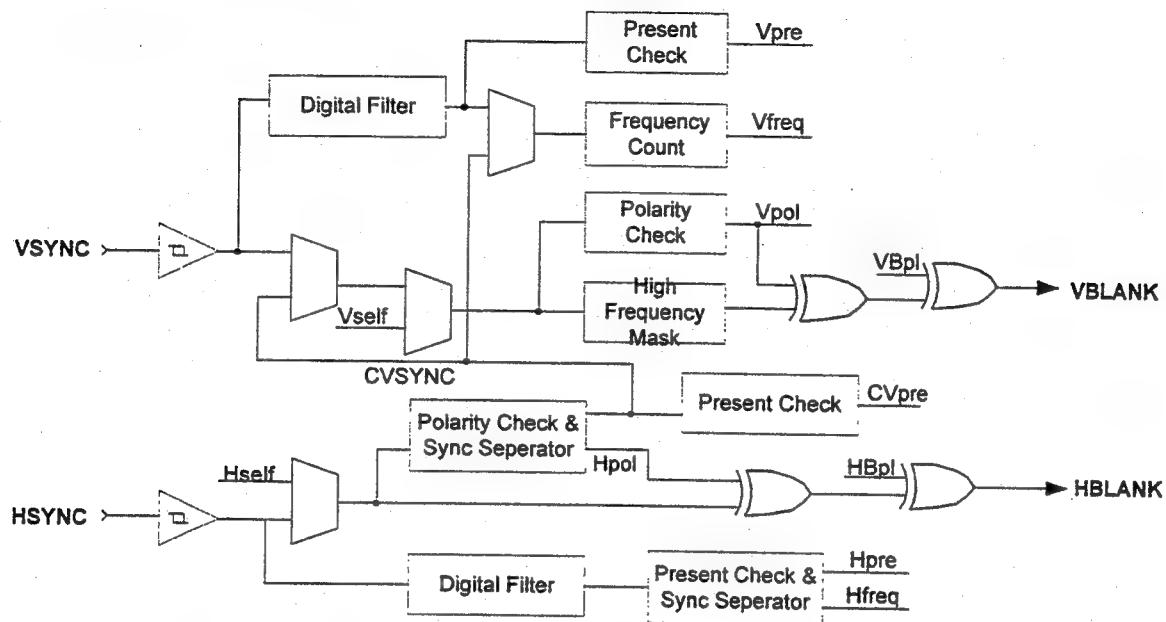

PIN#	Name	TYPE	Description
1	P1.0	I/O	SDA of I ² C for communication with ICS1523
2	P1.1	O	SCL of I ² C for communication with ICS1523
3	P1.2	O	Power switch of +5V and VLCD
4	P1.3	O	Fine tune function select
5	P1.4	O	H-Sync polarity
6	P1.5	O	V-Sync polarity
7	P1.6/ADD	O	Inverter enable
8	P1.7/AD1	O	AM100 Rest signal
9	RST	I	MPU Rest signal
10	HSCL	N.C.	
11	HSDA	N.C.	
12	ISDA	I/O	SDA of I ² C for communication with 24C08, MTV118, M52473
13	HSYNC	I	H-Sync input
14	ISCL	O	SCL of I ² C for communication with 24C08, MTV118, M52473
15	VSYNC	I	V-Sync output
16	HBK/P4.1	N.C.	
17	VBK/P4.0	O	Separated V-Sync signal from composite sync
18	X2	O	Oscillator output
19	X1	I	Oscillator input
20	VSS	-	Negative Power Supply
21	P2.0/INT0	-	Reserve
22	P2.1	I/O	SDA of I ² C for communication with AM100
23	P2.2	I/O	SCL of I ² C for communication with AM100
24	P2.3	-	Reserve
25	D13/P2.4	I	“+” key

THEORY OF CIRCUIT OPERATION

PIN#	Name	TYPE	Description
26	D12/P2.5	I	"1" key
27	D11/p2.6	I	"-" key
28	D10/P2.7	I	"2" key
29	STOUT/P4.2	-	N.C.
30	D9	O	LED 2
31	D8	O	LED 1
32	D7	O	Video offset control
33	D6	-	Reserve
34	D5	O	External H-Sync cutoff control
35	D4	O	Video gain control
36	D3	O	Sync on green /separate or composite select
37	D2	O	V-Sync select (VBK/external V-Sync)
38	D1	O	Free run mode enable
39	D0	O	Power of inverter on/off control
40	VDD	-	Positive Power Supply

THEORY OF CIRCUIT OPERATION

H/V SYNC Processing

The SYNC processing block performs the functions of composite signal separation, sync inputs presence check, frequency counting, polarity detection and control, as well as protection of VBLANK output while VSYNC speed up in high DDC communication clock rate. The preset and frequency function block treat any pulse shorter than one OSC period as noise.

Composite sync separate

The MTV112E continuously monitors the input HSYNC, if the vertical sync pulse can be extracted from the input, a CVpre flag is set and user can select the extracted "CVSYNC" for the source of polarity check, frequency count, and VBLANK. The CVSYNC will have 10-16 us delay compared to the original signal. The delay depends on the OSC frequency and composite mix method.

H/V Polarity Detect

The polarity functions detect the input HSYNC/VSYNC high and low pulses duty cycle. If the high pulse duration is longer than that of low pulse, the negative polarity is asserted; otherwise positive polarity is asserted. The HPLchg interrupt is set when the Hpol value changes. The VPLchg interrupt is set when Vpol value changes.

THEORY OF CIRCUIT OPERATION

H/V Frequency Counter

MTV112E can discriminate HSYNC/VSYNC frequency and saves the information in XFRs. The 15 bits Hcounter counts the time of 64XHSYNC period, but only 11 upper bits are loaded into the HCNT/HCNTL latch.

The 11 bits output value will be $(2/Hfreq) / (1/OSCfreq)$, updated once per VSYNC/CVSYNC period when VSYNC/CVSYNC is present or continuously updated when VSYNC/CVSYNC is non-present. The 14 bits Vcounter counts the time between two VSYNC pulses, but only 9 upper bits are loaded into the VCNTL/VCNT latch. The 9 bits output value will be $(1/Vfreq) / (512/OSCfreq)$, updated every VSYNC/CVSYNC period. An extra overflow bit indicates the condition of H/V counter overflow. The VFchg/HFchg interrupt is active when VCNT/HCNT value changes or overflow.

H/V Present Check

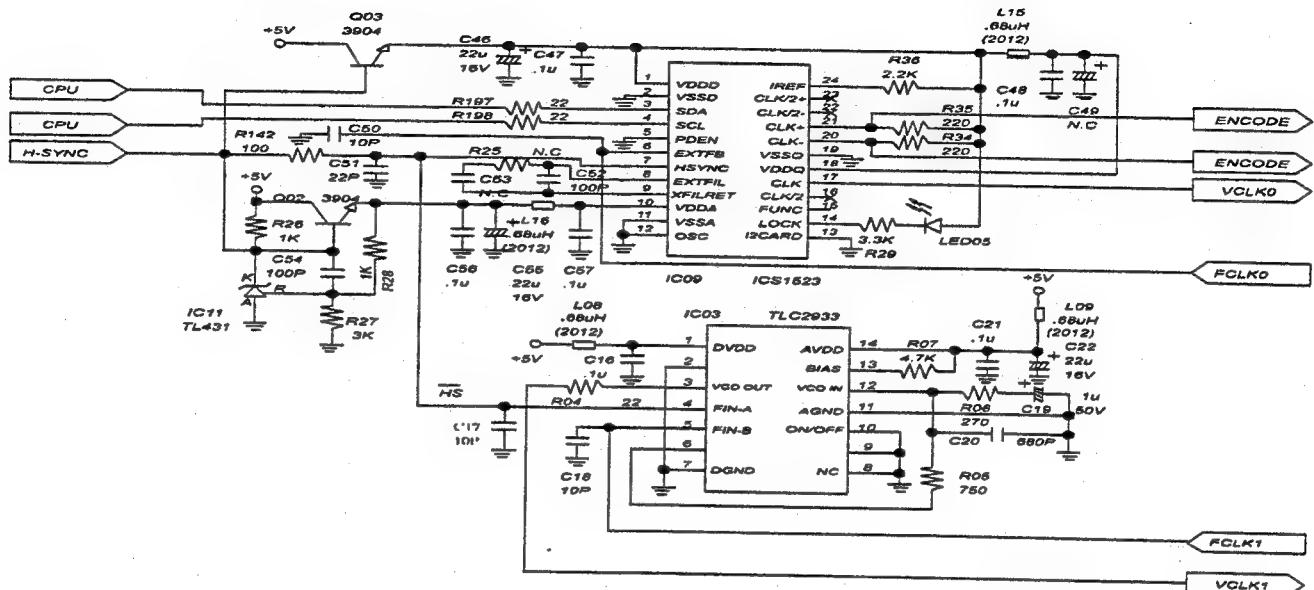

The Hpresent function checks the input HSYNC pulses, Hpre flag is set when HSYNC IS OVER 10KHz or cleared when HSYNC is under 10Hz. The Vpresent function checks the input VSYNC pulses, the Vpre flag is set when VSYNC is over 40Hz or cleared when VSYNC is under 10Hz. Acontrol bit "PREFS" selects the time base for these functions. The HPRchg interrupt is set when the Hpre value changes. The VPRchg interrupt is set when the Vpre/Cvpre value change. However, the Cvpre flag interrupt may be disabled when S/W disable the composite function.

Output HBLANK/VBLANK Control and Polarity Adjust

The HBLANK is the mux output of HSYNC and self-test horizontal pattern. The VBLANK is the mux output of VSYNC, CVSYNC and self-test vertical pattern. The mux selection and output polarity are S/W controllable. The VBLANK output is cut off when VSYNC frequency is over 200Hz or 133Hz depends on 8MHz/12MHz OSC selection. The HBLANK/VBLANK shares the output pin with P4.1/P4.0.

THEORY OF CIRCUIT OPERATION

PLL

The ICS1523 is a high performance frequency generator intended for line-locked and gen-locked high resolution video applications. It offers pixel clock outputs in both differential (to 250MHz) and single-ended (to 150MHz) formats. It is an effective clock solution for video projectors and displays at resolutions from VGA to beyond XGA. The advanced phase-locked loop utilizes either its internal programmable feed-backed divider or an external divider. The device is programmed by a standard I²C – bus TM serial interface. ICS1523 adopts external feedback method to create the sampling clock to provide the A/D converter (AM30). When external divider changes the divisor, the sampling clock frequency is changed.

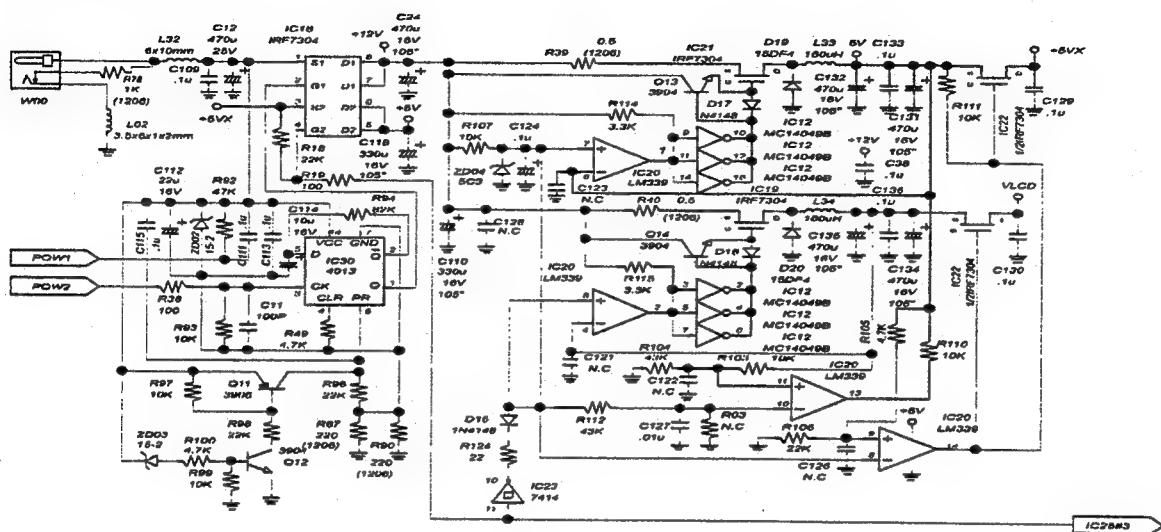

The TLC2933 is designed for phase-locked-loop systems and is composed of a voltage-controlled oscillator (VCO) and an edge-triggered-type phase frequency detector (PFD).

The Oscillator frequency range of VCO is set by an external bias resistor (R07). The high-speed PFD with internal charge pump detects the phase difference between the reference frequency input and signal frequency input from the external divider.

The main purpose of TLC2933 is to create the dot clock to the panel.

THEORY OF CIRCUIT OPERATION

POWER SYSTEM

This product uses an external power adapter to provide the DC +12 volts.

In order to greatly reduce the power assumption when in power saving stage, the circuit in Fig. 1 is used not only to convert the 12 V to 5 V, but also to control the 5V's ON/OFF status. IC30(4013) is a D-Flop Flop CMOS and IC18 is a P-Channel MOSFET. When $V_{GS} < 0.7$ V, MOS turns on. As showed in the circuit, when 12 V DC currents enter W09, it creates a pulse through C115 and presets the Flip-Flop. When Q(IC30, pin 1) is in high level, the 12 V could not pass IC18 and the whole system is kept OFF status. When press the power switch, the pin 3 of IC30 creates a pulse to force Q to be low level. The pin 7 & 8 is conducted and the 12 V enters the whole system.

There are two regulators that convert the 12 V to 5 V. They are +5Vx and VLcd.

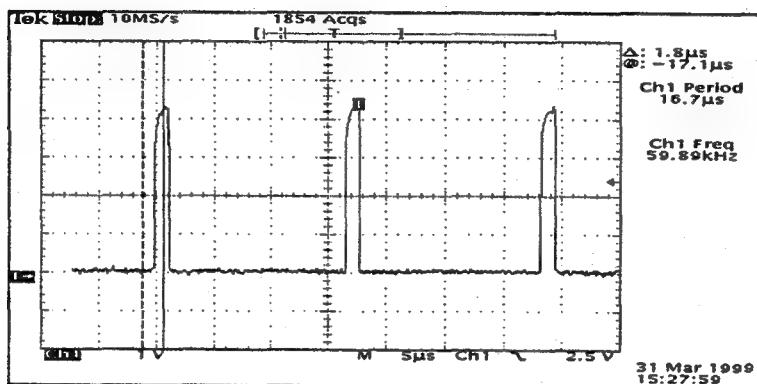

The comparator of IC20 will make the output of two regulators as a feed back to compare with the reference voltage. The compared result will control the IC19 ON/OFF time to achieve the voltage regulation effects. ZD04 will create the reference voltage. Q13, 14 and MC14049 are basically used to speed up the MOSFET ON/OFF switching time in order to reduce IC19 power assumptions.

This product also equips with over-voltage protection circuit. When voltage at N09 is over 15 Volts, Q12 will turn on to make the pin 6 of IC30 always at high level and IC18 will be in off level.

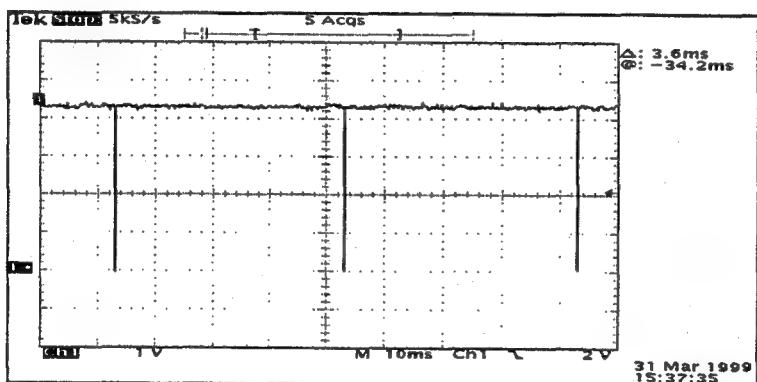

The +5 V and VLCD sources provide most of the required power for the VG150 and LCD panel. When system enters the power saving stage, the above two power sources will turn off through the pin 3 of IC25. The + 5 V source provides power to the CPU and SYNC processor, so it must be isolated from other power sources. When in power saving stage, the pin 3 of IC25 will be set to low level to make the +5 V and VLCD to be cut off.
